new
Brushes

The fibre isolation square has now been repositioned under the brush bracket. (Rookie mistake corrected) The wire still follows the channel in the brush housing.

The red wire now grounds the inner brush to the stator and thus will be connected with the black ground from the Reg/rect unit. Green wire is from the outer brush; intend to connect to the Green wire from Reg/rect. Three whites are for the Reg/rect unit and the blue wire is not connected to the stator.

Proposed connections:

- Stator Green to Reg/rect Green
- Stator Red to Reg/rect Ground and frame ground
- Stator White(3) to Reg/rect whites

- Reg/rect Red to battery (fused)
- Reg/rect Brown to Switched Power
- Reg /rect White, Green & Black as above.
